ShowOnce: The App I Build That Learns Any Repetitive Job by Watching You Do It Once

The gap: your team does the same job every day, by hand, forever

Every growing business has a job like this. A customer sends an order on WhatsApp, and someone copies it into the order sheet. An enquiry arrives by email, and someone types the details into the booking form. A payment lands, and someone updates the spreadsheet, sends the confirmation, and files the receipt. The work is not hard. It is the same, every single day.

Here is what that sameness actually costs:

- **It eats the hours nobody counts.** A 10-minute job done 5 times a day is 50 minutes a day - gone before lunch, every day, on work that adds nothing new.
- **It only gets worse as you grow.** More orders mean more copying. The business that wins more customers is punished with more admin.
- **It is where mistakes live.** Copy a number wrong once and the wrong item ships, the wrong price is charged, or the booking is lost. Repetition is not just boring - it is the most error-prone work in the business.
- **It traps your best people.** The person who knows the customers, the products, and the answers is stuck retyping the same fields instead of serving the next customer.

Most owners accept this as the price of running a business. It is not. It is a job a machine can learn - if someone shows it once.

And that is exactly what the newest wave of tools is proving. On 2 November 2026, a tool called Click reached #2 on Product Hunt with a simple idea: a "managed agents API that works with any model". As The Neuron's digest put it the same day, "Click watches you demonstrate a repetitive workflow and turns it into an AI-agent automation that runs across your connected systems." You do the job once, on screen, and the agent learns it. The technology to watch-and-repeat is here. What most businesses are missing is the app around it - built for their own workflow, their own tools, their own team.

The app I build: ShowOnce - demonstrate it once, and it replays forever

This is a custom application built for one business's own repetitive work. The owner - or a member of staff - demonstrates the job once, on screen, inside the app. ShowOnce records the steps, learns the pattern, and then replays it on its own, every time the job comes up. Here is what it does, piece by piece:

1. The one-time demonstration recorder. You do the job once, exactly as you do it today: open the WhatsApp order, copy the details into the order sheet, confirm the total. ShowOnce watches the clicks, the fields, and the order of steps, and turns them into a repeatable workflow. No code, no flowcharts, no explaining the process to a developer.

2. The replay engine. Once learned, the workflow runs itself. A new WhatsApp order arrives, and ShowOnce copies it into the order sheet, fills in the totals, and marks it ready - the same way you did

it, every time. The job that took 10 minutes now takes none.

3. Your connected systems, one workflow. The job rarely lives in one place. ShowOnce connects the tools the business already uses - WhatsApp, email, the order sheet, the booking form, the payment record - so a single demonstration can reach across all of them. The order copied from WhatsApp can trigger the confirmation message and update the sheet in the same run.

4. A human checkpoint where it matters. Automation should never send the wrong thing to a customer. Before any step that touches a customer - a confirmation, a price, a booking - ShowOnce can pause and ask a human to approve it with one tap. The routine runs itself; the judgment stays with you.

5. An exception queue, not a silent failure. When something does not match the pattern - a new product, an unusual request, a missing detail - ShowOnce does not guess. It puts the case in a short exception queue for a human to handle, and learns from the decision. The app gets smarter instead of making the same mistake twice.

6. A time-saved dashboard. Every replay is counted. The owner sees how many times each workflow ran this week, how many minutes it saved, and which jobs are still done by hand. The return on the app is visible on one screen, not a matter of faith.

Why this matters: repetition is the tax on growth

A business does not slow down because the work is hard. It slows down because the same easy work has to be done again and again, and every new customer adds more of it. The owner who answers every enquiry personally cannot also take the next ten enquiries. The team that retypes every order cannot also chase the next sale.

That is the trap: the better the business does, the heavier the admin gets. Hiring helps, but a new hire doing the same copying inherits the same mistakes and the same cost - plus a salary.

An app that learns a job by watching it once breaks the link between growth and admin. The tenth order costs the same effort as the first: none. The business can take more customers without taking on more copying - and the people who know the customers get their day back.

Business impact: what one repetitive job actually costs (illustrative math)

Take a small shop where one 10-minute job - copying a WhatsApp order into the order sheet and confirming it - happens 5 times a day. These are illustrative numbers, but the shape of the math is real.

- **The daily cost:** 10 minutes x 5 orders = 50 minutes a day. Nearly an hour, every working day, on copying.
- **The monthly cost:** 50 minutes a day x 22 working days = about 18 hours a month. That is more than two full working days a month, spent retyping.
- **The yearly cost:** 18 hours a month x 12 = about 216 hours a year - over five working weeks - on a single repetitive job.
- **The compounding cost:** that is one job. Most businesses have three or four like it: enquiries, bookings, payments, follow-ups. Multiply the pattern and the admin quietly becomes a part-time salary.

- **The hidden cost:** every manual copy is a chance to get a number wrong - the wrong item, the wrong price, the wrong date. One error can cost a refund, a lost customer, or a day of untangling.

ShowOnce does not bring in more customers. It gives the business back the hours its existing customers already paid for - and removes the ceiling that repetition puts on growth.

How it is built: the step-by-step roadmap

1. **Pick the job.** Choose the single most repeated task - the one done every day, the same way, in the same tools. Copying WhatsApp orders into the order sheet is the classic first job.

2. **Map the tools it touches.** List the systems the job crosses: WhatsApp, the order sheet, email, the booking form. The app connects to each one through its official API, so it reads and writes real data.

3. **Prompt the build.** A prompt template describes the demonstration recorder, the replay engine, the human checkpoint, and the time-saved dashboard - this is the blueprint the app is built from.

4. **Build the app.** The recorder, the workflow engine, and the dashboard are built with a vibe-coding tool - v0, Lovable, Bolt, or Replit - with the demonstration-to-workflow logic coded in as the core of the app.

5. **Wire the replay engine.** The learned workflow is connected to the business's real tools through their APIs, with a managed agent layer - the same watch-and-repeat idea behind tools like Click - doing the replay across systems.

6. **Add the human checkpoint.** Steps that touch a customer pause for a one-tap approval, and anything unusual goes to the exception queue instead of being guessed at.

7. **Deploy.** The app ships on Vercel or Netlify, and the team demonstrates each new job once, then watches the time-saved dashboard climb.

Checklist: is repetition taxing your business?

- [ ] You can name the one job your team repeats most - the same steps, every day.
- [ ] You know roughly how many minutes that job takes, and how many times a day it happens.
- [ ] That job crosses more than one tool - WhatsApp, a sheet, email, a booking form.
- [ ] A copying mistake in that job has cost you money or a customer before.
- [ ] Someone on your team spends more than 30 minutes a day on work that never changes.
- [ ] You could show someone the job once, on screen, and they would understand it.

If you ticked three or more, repetition is already taxing your growth - and it is a job an app can learn by watching once.
